

ABSTRACT

A small resin tube used in curtains is disclosed. The resin tubes are made of foamed polypropylene with natural style and curtains are made of such small tube. Moreover, the method for manufacturing the small tube is also disclosed. Longitudinal fine textures are formed on the surface of the small tube. Irregular concave-convex textures are also formed with large distances. Polypropylene and foaming agent are put into an extruder, and feed to a mould and then are extruded from a ring-shape outlet of the mould after they are melted and blended. Then the extruded tube is solidified in cooling tank and cut to a predetermined length. Moreover, the resin tube can be used to weave curtains.
